Bias in data: a motivational example

- Assume an entire population of 100 people
 - 50 men, 50 women
 - 70 from country A, 30 from country B
- We do a survey with 10 participants
 - 8 men, 2 women
 - 8 from country A, 2 from country B

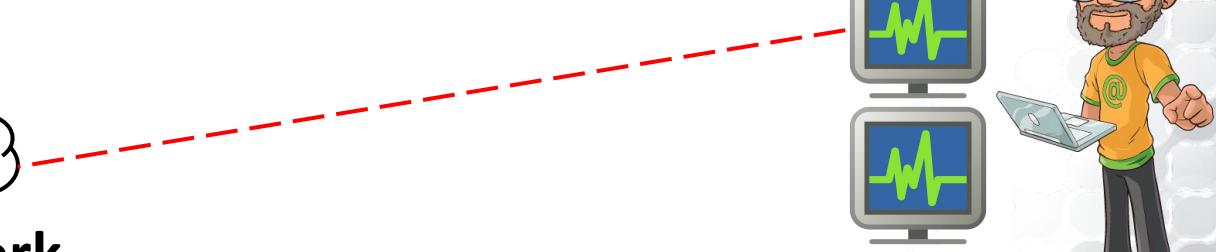

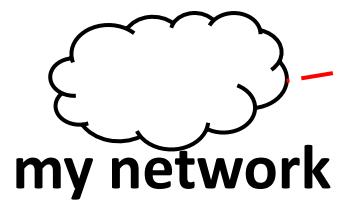

| | Men | Women | Country A | Country B |
|-------------------|-----|-------|-----------|-----------|
| Entire population | 50% | 50% | 70% | 30% |
| Survey sample | 80% | 20% | 80% | 20% |

- Is there bias? → Yes! difference in the gender/country distributions between population & sample
- Is bias the same along gender/country? → No! sample is more biased wrt. the gender dimension
- Is bias a problem? → It depends!
 - Goal: estimate the average population height (gender bias **is** a problem, country bias **may be** a problem)
 - Goal: calculate % of native spoken languages (gender bias **is not** a problem, country bias **is** a problem)

The Internet

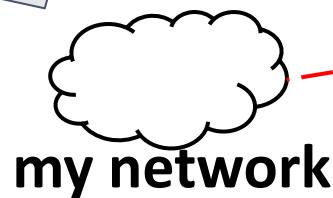

The Internet

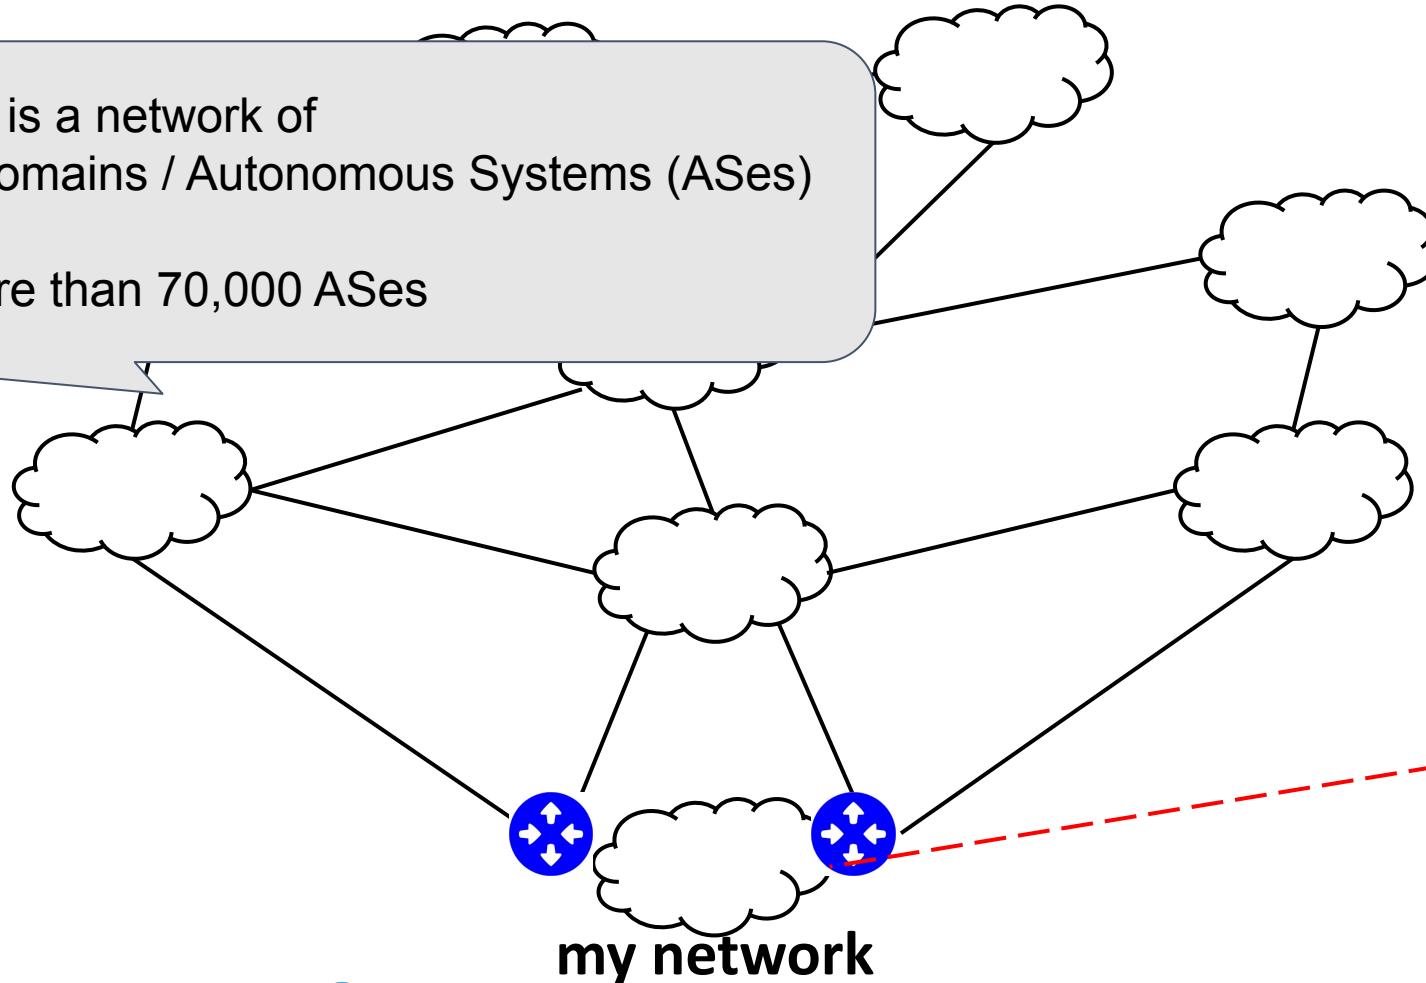

The Internet

A “**domain**” or “**Autonomous System (AS)**” is a network or a collection of networks that are all managed, controlled and supervised by a single entity or organization

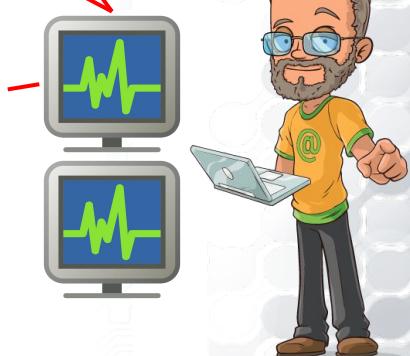

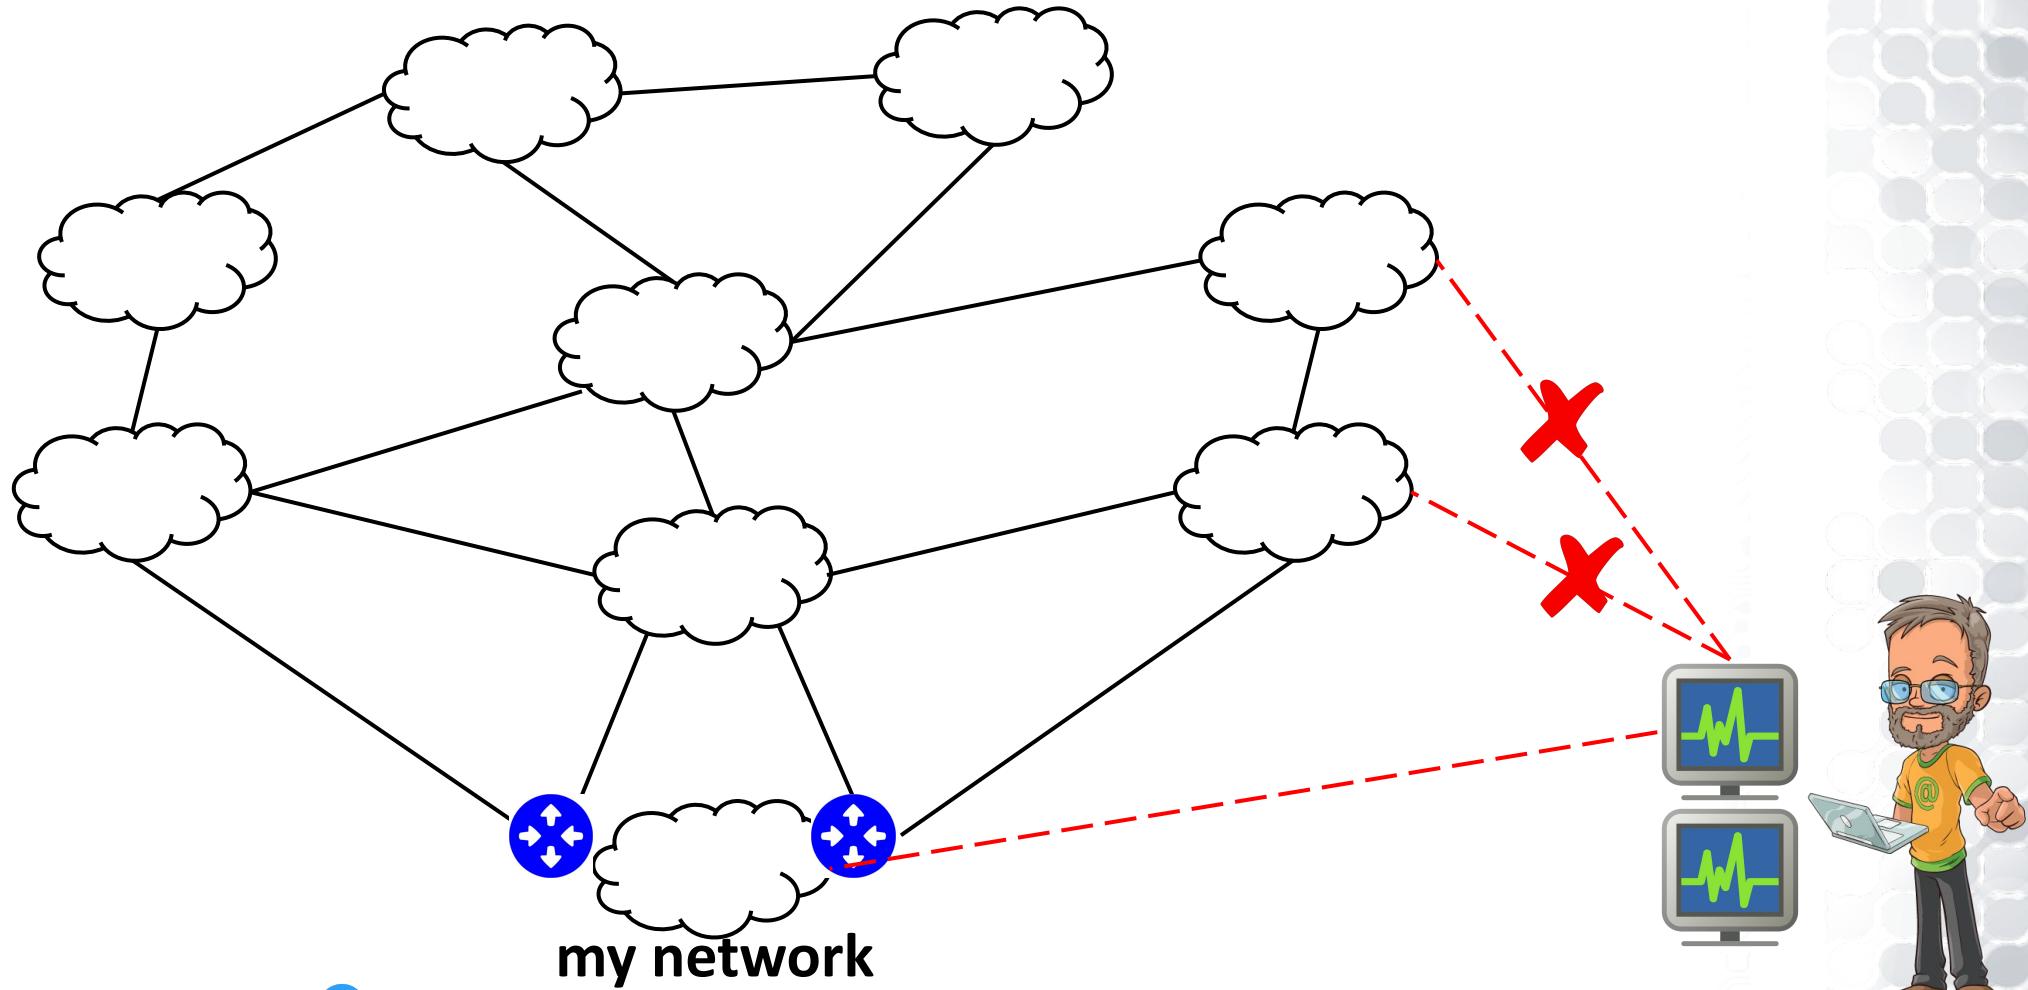

The Internet

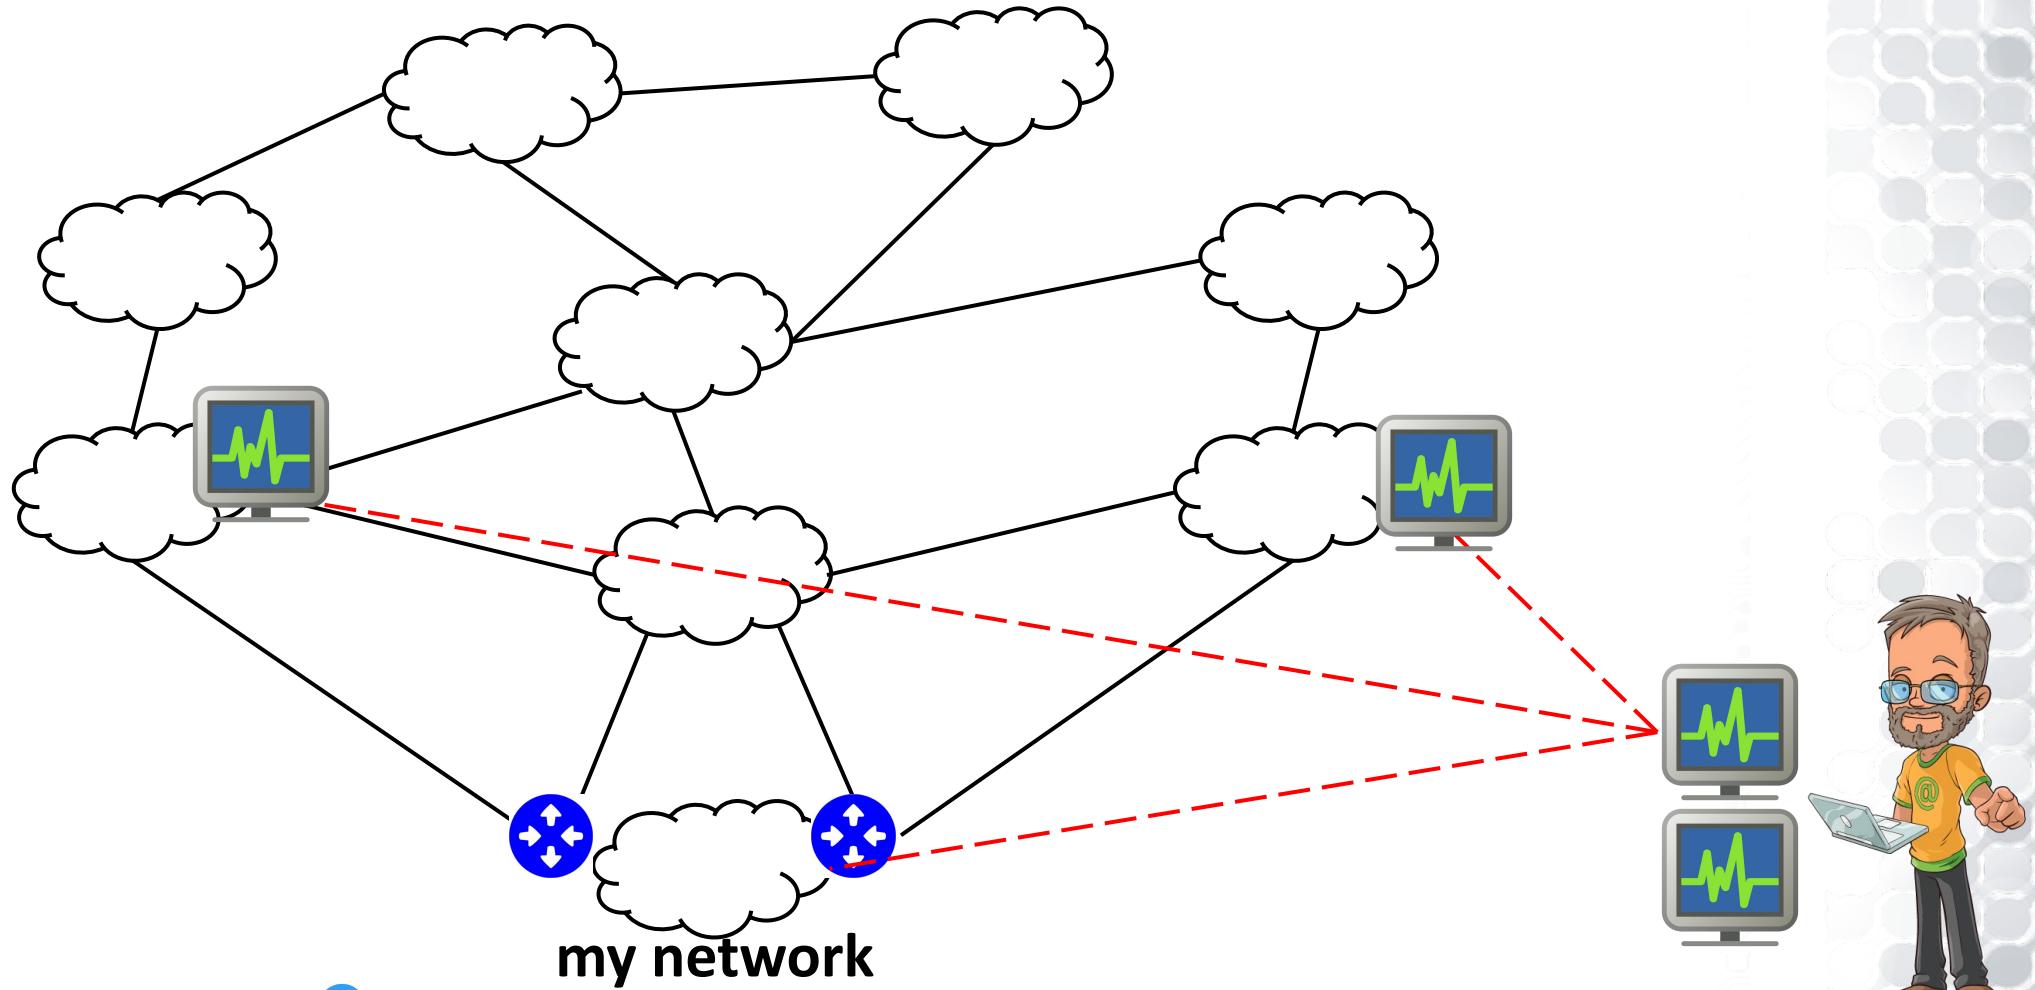

- The Internet is a network of networks / domains / Autonomous Systems (ASes)
- today → more than 70,000 ASes

Inter-domain monitoring

Internet measurement platforms

Internet measurement platforms

<https://atlas.ripe.net/>

- data plane measurements
- > 11,000 probes & anchors
- in > 3000 ASNs

<http://www.routeviews.org>

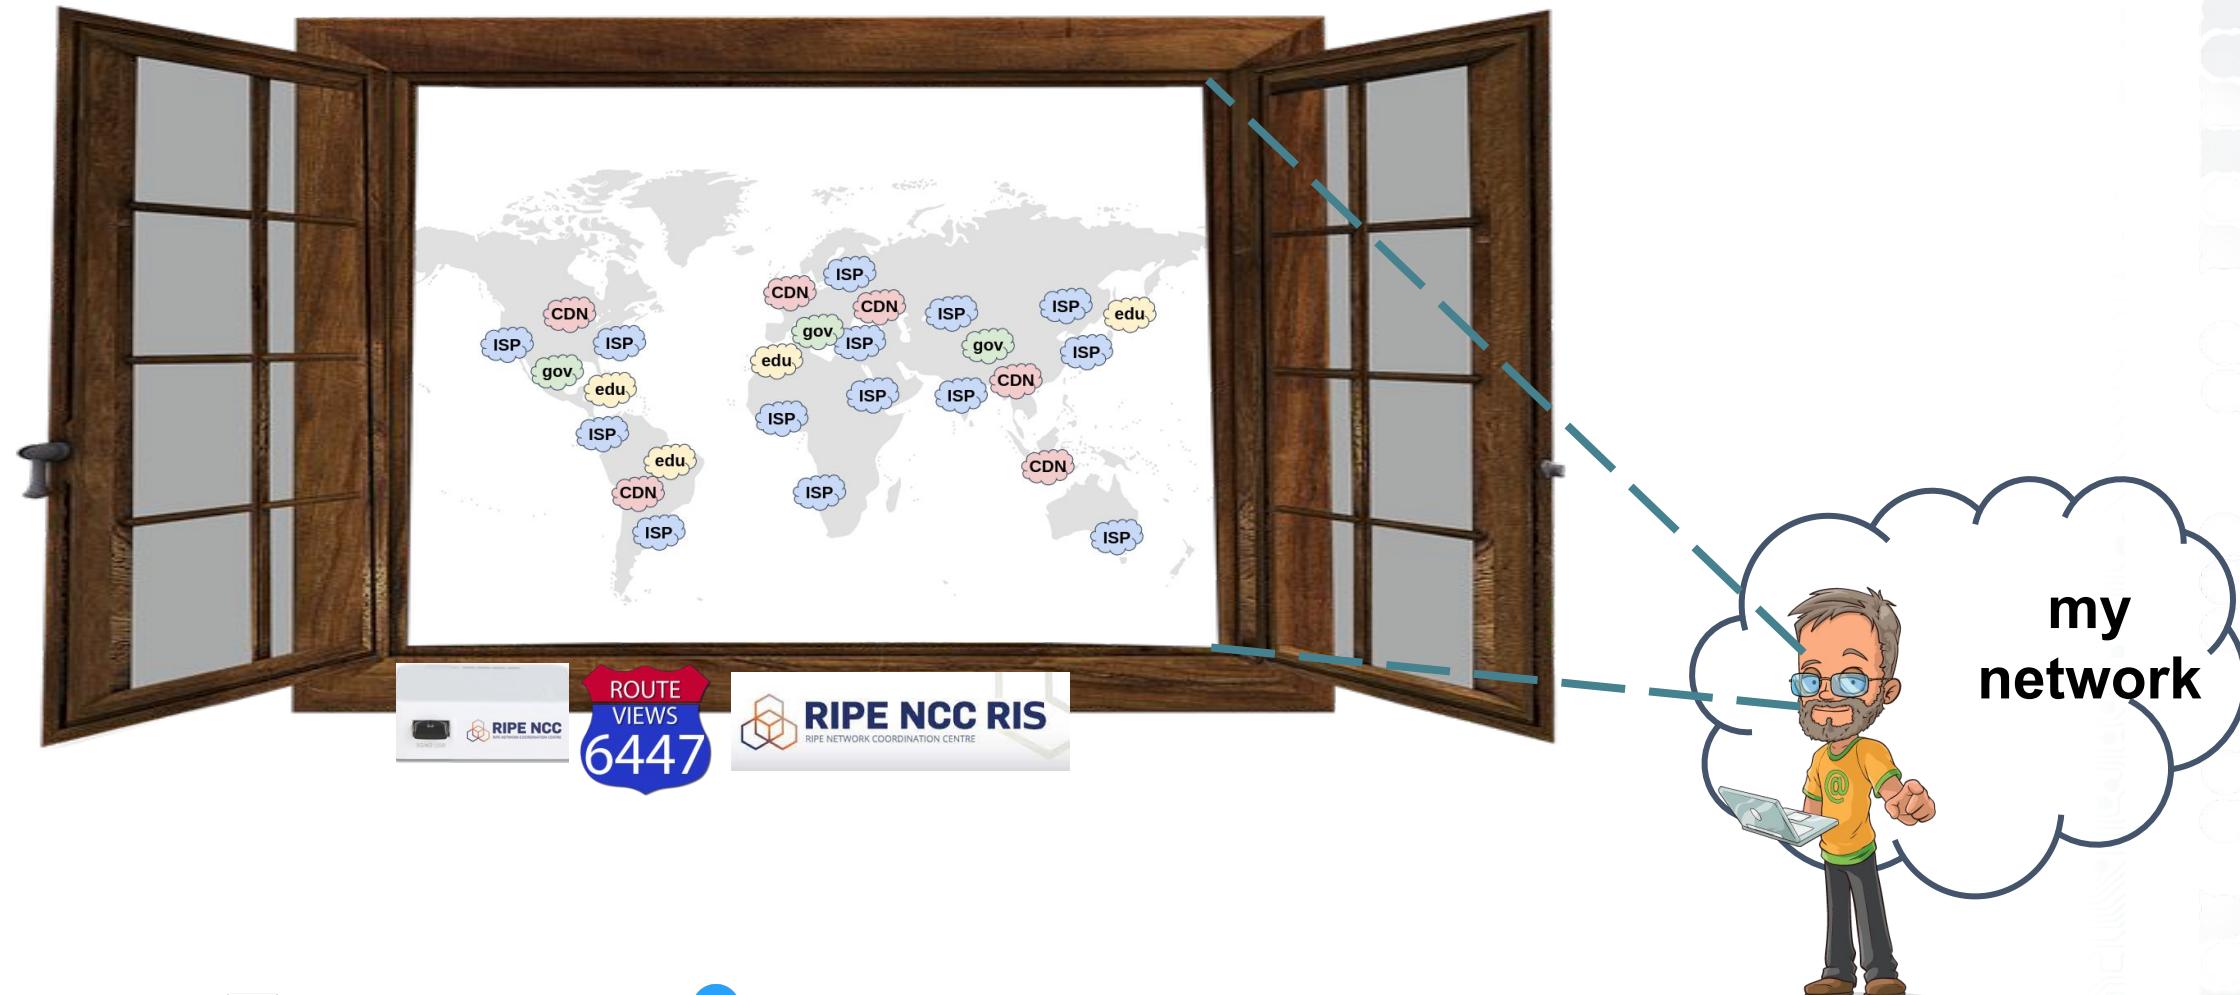

- BGP RIBs & updates
- 36 route collectors
- peering with > 300 ASNs

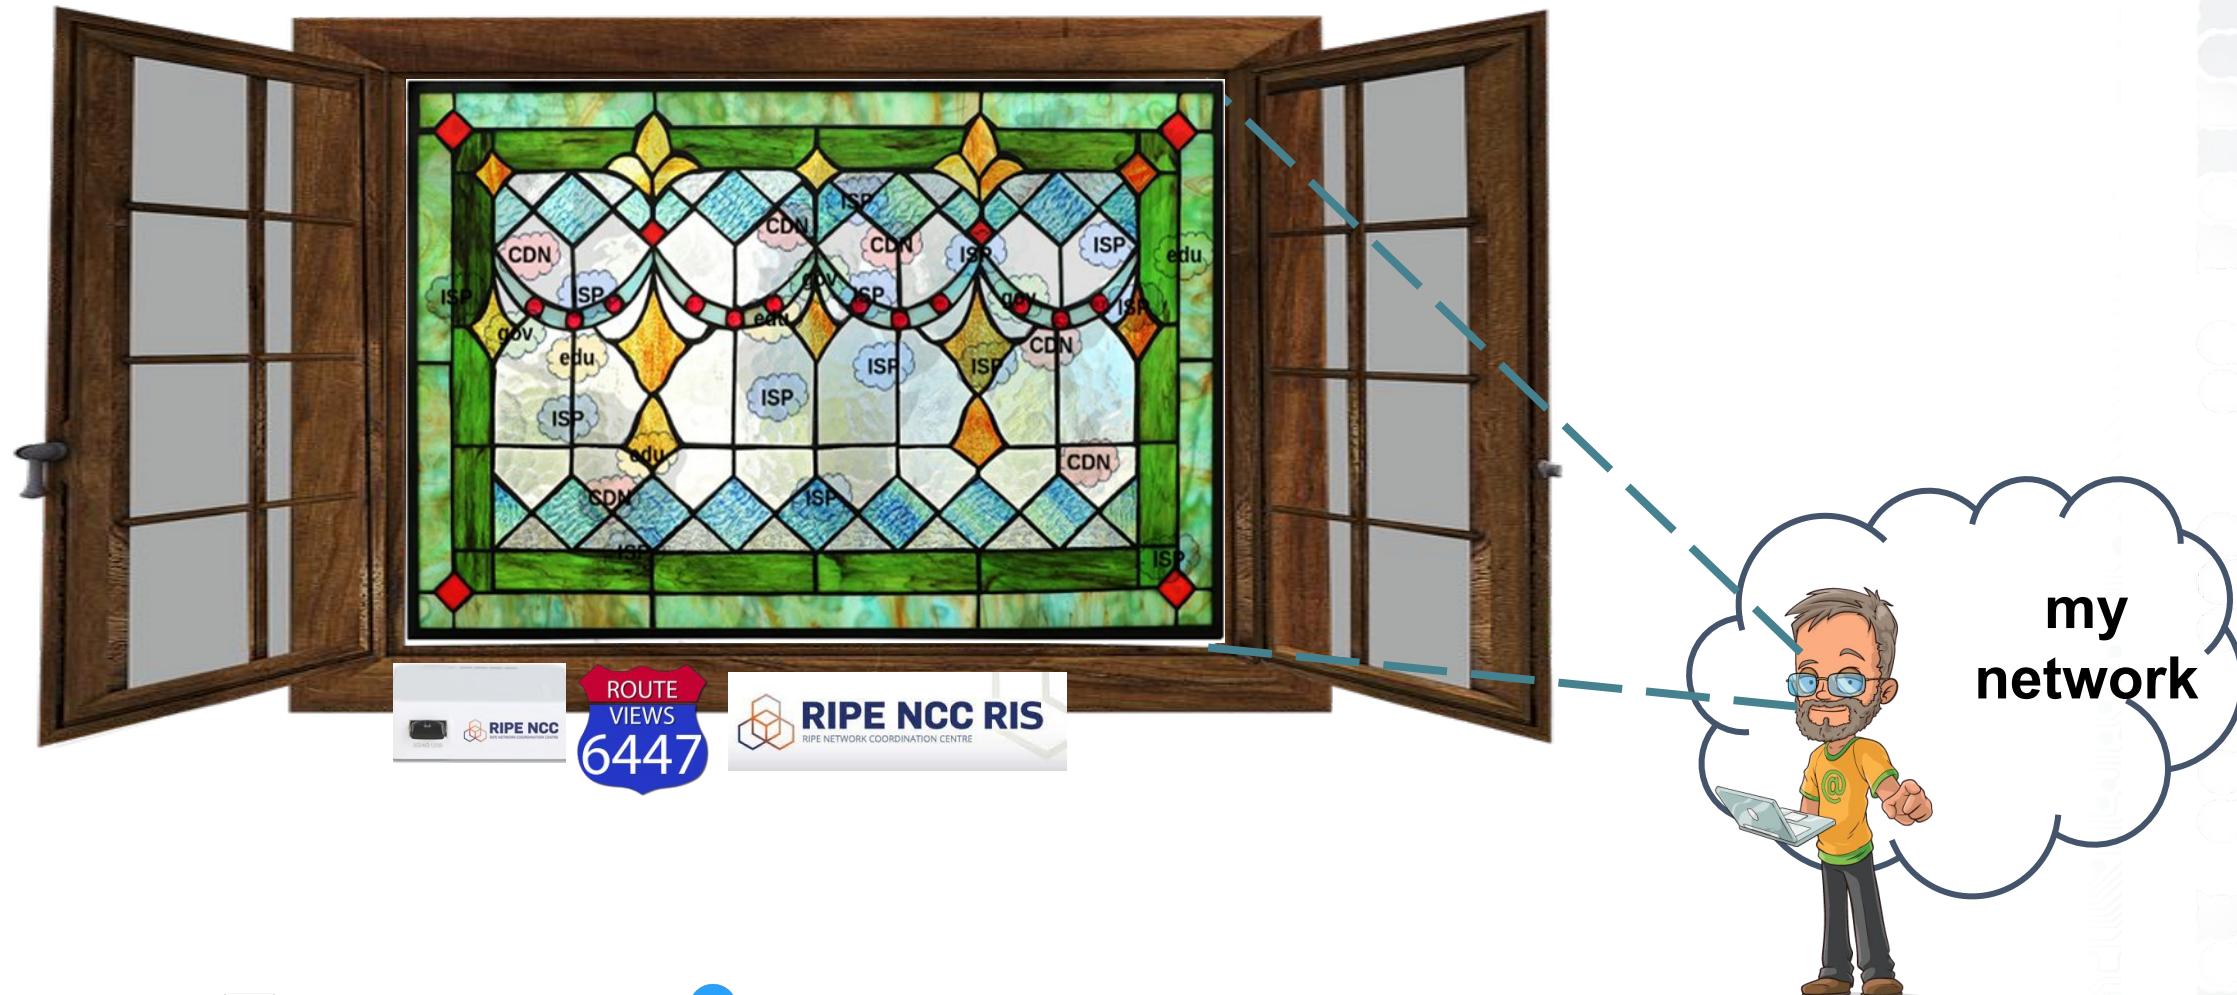

<https://ris-live.ripe.net/>

- BGP RIBs & updates
- 27 route collectors
- peering with > 500 ASNs

Measurement platforms: a window to the Internet

... but, in practice: a *stained glass window*

The “stained glass” view == Bias

not all network types can be equally seen by the platforms

→ our view of the Internet is **biased**

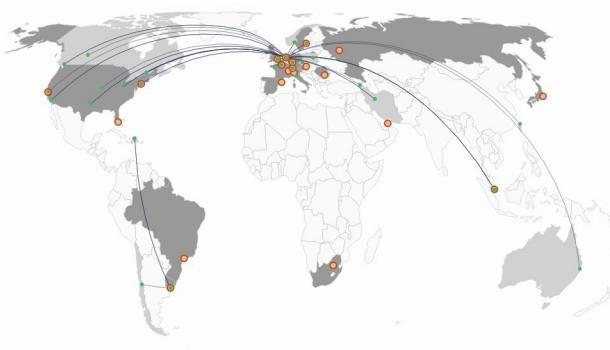

Example 1 (location bias)

- RIPE Atlas & RIPE RIS have more probes/peers in Europe

RIPE Atlas probes

<https://atlas.ripe.net/results/maps/network-coverage/>

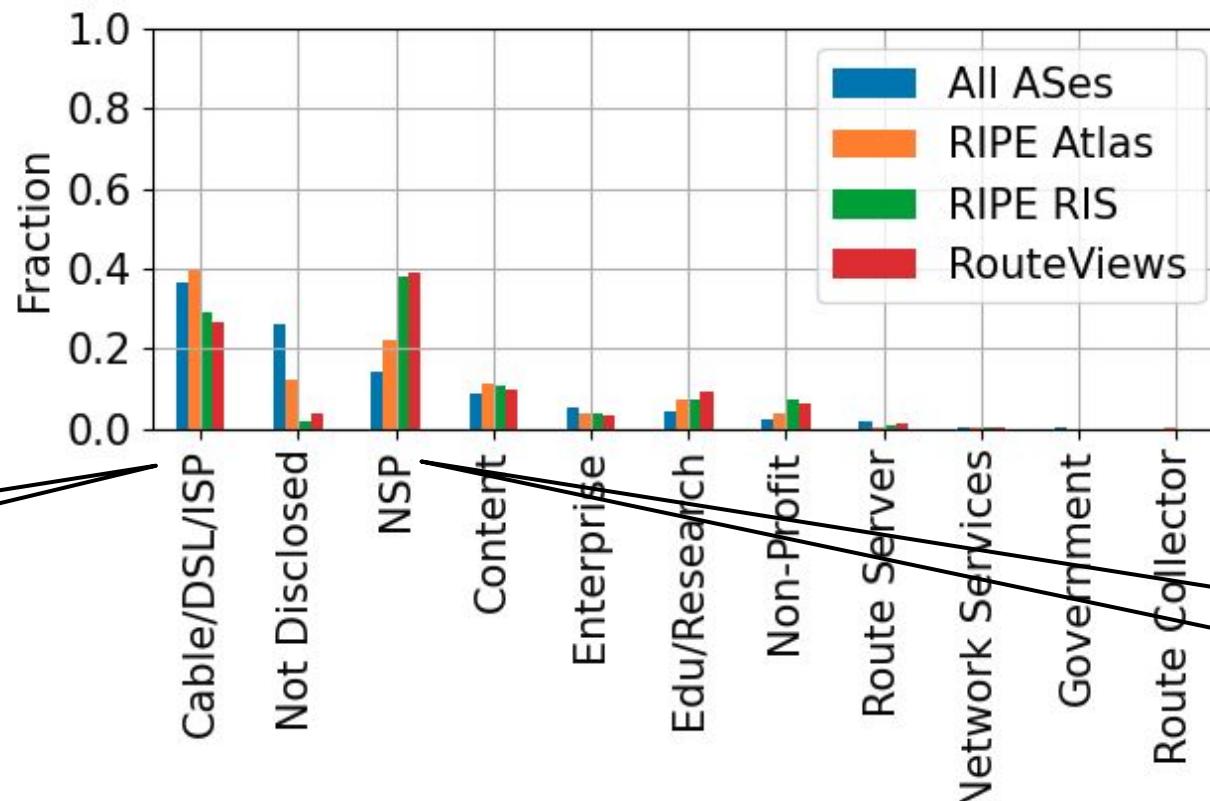

RIPE RIS route collectors

<https://observablehq.com/@emileaben/ris-route-collectors-and-peer-locations>

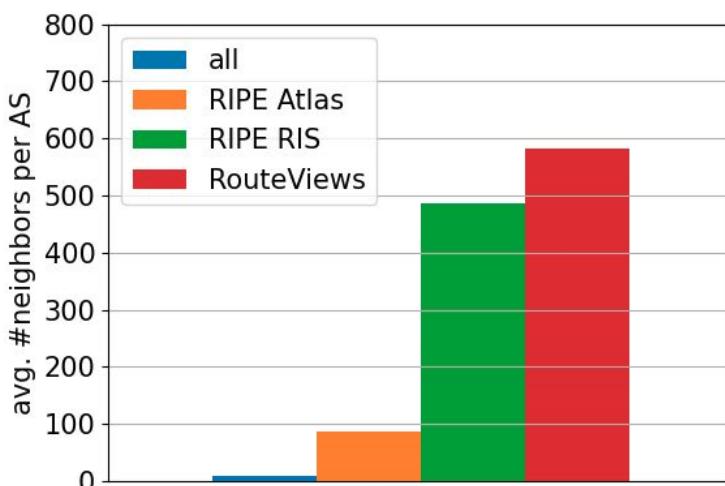

Example 2 (network-type bias)

- Peers of **RIPE RIS** and **RouteViews** do not equally represent all network types

Example 3 (topological bias)

- ASes that feed to **RIPE RIS/RouteViews** or host **RIPE Atlas** probes, are networks that typically peer with many other networks

Quantifying bias

- Many dimensions of bias
 - *location, network size, topology, IXP connectivity, network type, etc.*

Internet data sources

- CAIDA AS-rank
 - Network information: location, network size, topology, etc.
- CAIDA AS-relationships
 - Graph information: edgelist (i.e., peering links)
- Peering DB
 - Network information: connectivity, network type, traffic, etc.
- AS hegemony
 - Network information: size, topology
- Country-level Transit Influence (CTI)
 - Network information: size, topology
- ASDB
 - Network information: network types

**22 features/characteristics
per network
(i.e., the bias “dimensions”)**

The compiled dataset

← 22 network features/characteristics →

→ 74k networks →

| ASN | Location-related information | | Network-size related information | | | Topology-related information | | IXP-related information | | Network type-related information | | |
|-------|------------------------------|---------------|----------------------------------|-------------|-----|------------------------------|-----|-------------------------|-----|----------------------------------|----------------------|-----|
| | RIR Region | Continent | Customer cone (in #ASNs) | AS hegemony | ... | #neighbors (in #ASNs) | ... | #IXPs connected to | ... | Net. type (PeeringDB) | Net. type (ASDB) | ... |
| 174 | ARIN | North America | 32457 | 0.09 | ... | 6614 | ... | 0 | ... | NSP | ICT | ... |
| 1299 | RIPE | Europe | 37162 | 0.10 | ... | 2328 | ... | 0 | ... | NSP | ICT | ... |
| 2497 | APNIC | Asia | 507 | 0.01 | ... | 338 | ... | 16 | ... | NSP | NaN | ... |
| 3320 | RIPE | Europe | 3015 | 0.01 | ... | 667 | ... | 5 | ... | NSP | ICT | ... |
| 3333 | RIPE | Europe | 3 | 0.00 | ... | 320 | ... | 1 | ... | Non-profit | ICT | ... |
| 5470 | RIPE | Europe | 1 | 0.00 | ... | 1 | ... | NaN | ... | NaN | Education & Research | ... |
| 15169 | ARIN | North America | 12 | 0.01 | ... | 366 | ... | 214 | ... | Content | ICT | ... |
| ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... |

Quantifying bias

- Many dimensions of bias
 - *location, network size, topology, IXP connectivity, network type, etc.*
- Bias score per dimension
 - Bias == Difference between two distributions (**all networks** vs. **networks with vantage points**)
 - **Bias score:** Kullback-Leibler divergence metric
 - i.e, a value between 0 (low bias) and 1 (high bias)

| ASN | Location-related information | | Network-size related information | | |
|-------|------------------------------|---------------|----------------------------------|-------------|-----|
| | RIR Region | Continent | Customer cone (in #ASNs) | AS hegemony | ... |
| 174 | ARIN | North America | 32457 | 0.09 | ... |
| 1299 | RIPE | Europe | 37162 | 0.10 | |
| 2497 | APNIC | Asia | 507 | 0.01 | |
| 3320 | RIPE | Europe | 3015 | 0.01 | |
| 3333 | RIPE | Europe | 3 | 0.00 | |
| 5470 | RIPE | Europe | 1 | 0.00 | |
| 15169 | ARIN | North America | 12 | 0.01 | |
| ... | ... | ... | ... | ... | ... |

Quantifying bias

- Many dimensions of bias
 - *location, network size, topology, IXP connectivity, network type, etc.*
- Bias score per dimension
 - Bias == Difference between two distributions (**all networks** vs. **networks with vantage points**)
 - **Bias score:** Kullback-Leibler divergence metric
 - i.e, a value between 0 (low bias) and 1 (high bias)

| ASN | Location-related information | | Network-size related information | | |
|-------|------------------------------|---------------|----------------------------------|-------------|-----|
| | RIR Region | Continent | Customer cone (in #ASNs) | AS hegemony | ... |
| 174 | ARIN | North America | 32457 | 0.09 | ... |
| 1299 | RIPE | Europe | 37162 | 0.10 | |
| 2497 | APNIC | Asia | 507 | 0.01 | |
| 3320 | RIPE | Europe | 3015 | 0.01 | |
| 3333 | RIPE | Europe | 3 | 0.00 | |
| 5470 | RIPE | Europe | 1 | 0.00 | |
| 15169 | ARIN | North America | 12 | 0.01 | |
| ... | ... | ... | ... | ... | ... |

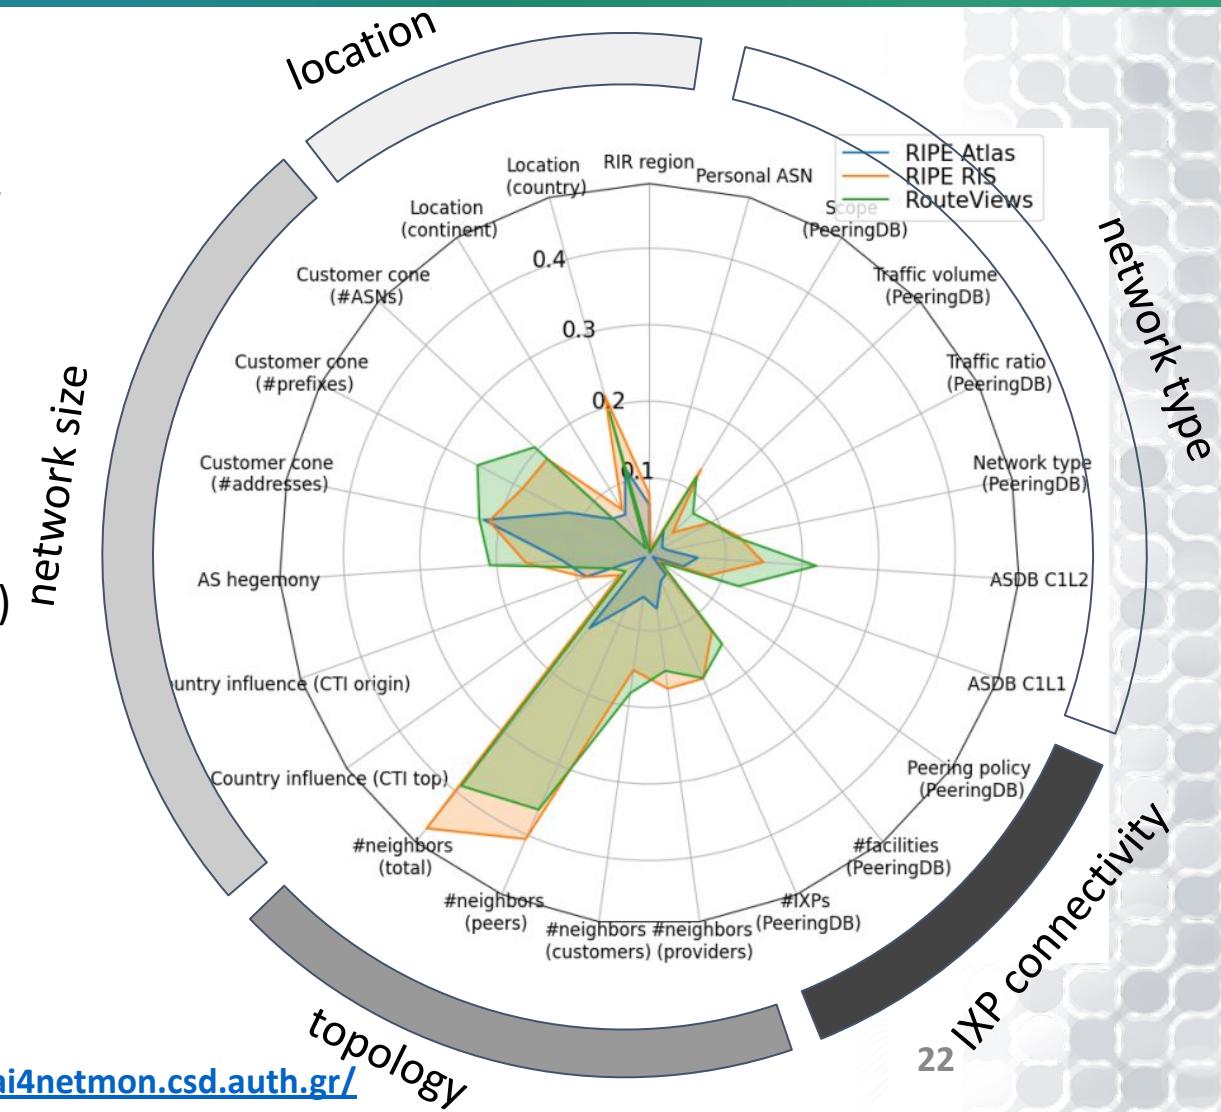

Quantifying bias

- Many dimensions of bias
 - *location, network size, topology, IXP connectivity, network type, etc.*
- Bias score per dimension
 - Bias == Difference between two distributions (**all networks** vs. **networks with vantage points**)
 - **Bias score:** Kullback-Leibler divergence metric
 - i.e, a value between 0 (low bias) and 1 (high bias)

| ASN | Location-related information | | Network-size related information | | |
|-------|------------------------------|---------------|----------------------------------|-------------|-----|
| | RIR Region | Continent | Customer cone (in #ASNs) | AS hegemony | ... |

| 2497 | APNIC | Asia | 507 | 0.01 | |
| 3320 | RIPE | Europe | 3015 | 0.01 | |
| 3333 | RIPE | Europe | 3 | 0.00 | |
| 5470 | RIPE | Europe | 1 | 0.00 | |
| 15169 | ARIN | North America | 12 | 0.01 | |
| ... | ... | ... | ... | ... | ... |

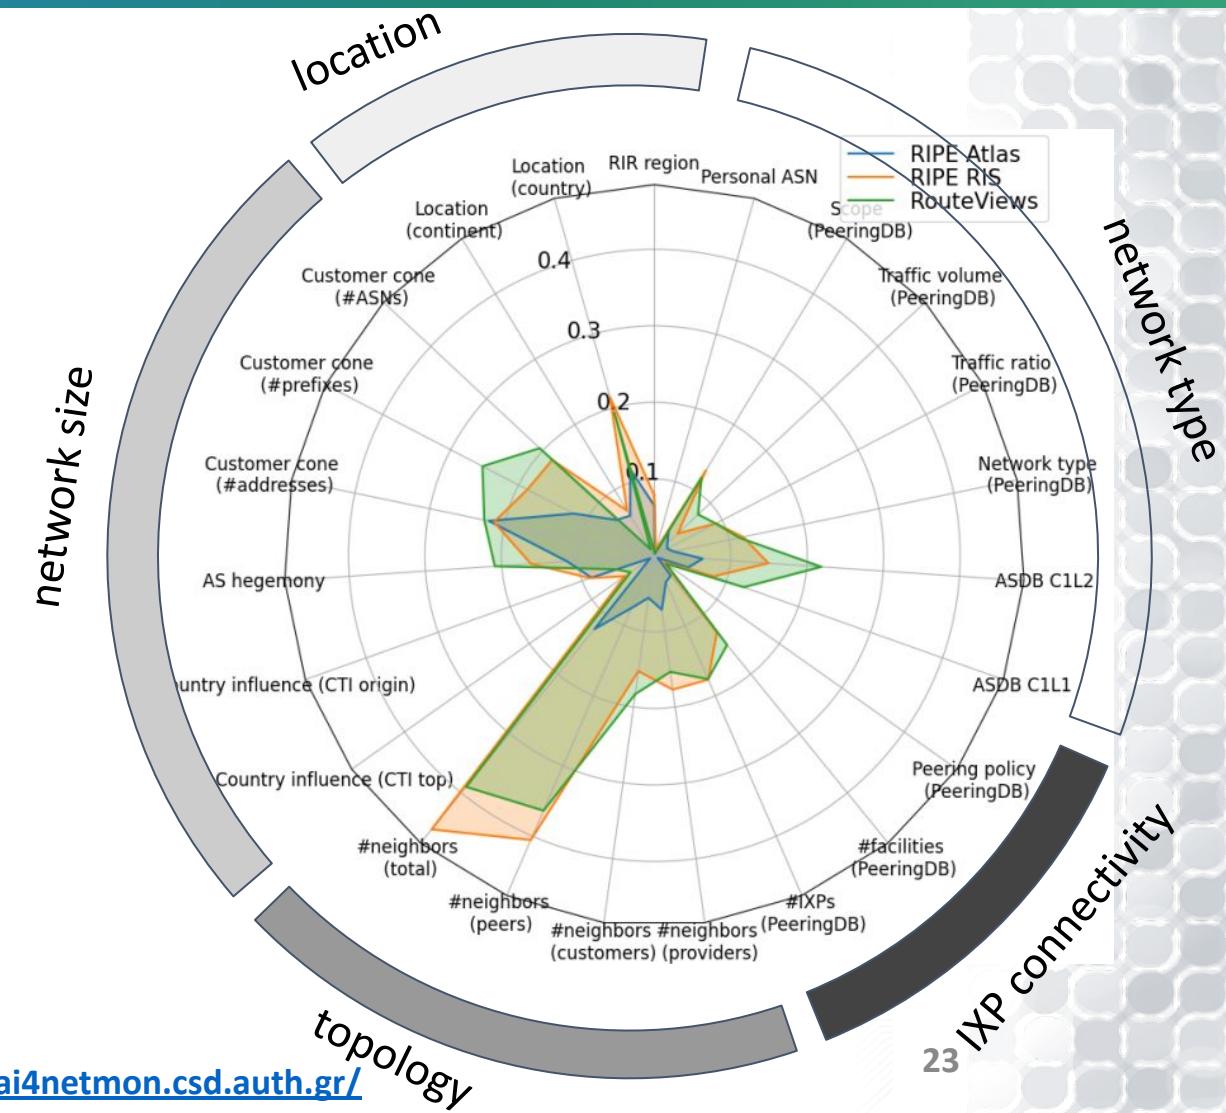

Quantifying bias

- Many dimensions of bias
 - *location, network size, topology, IXP connectivity, network type, etc.*
- Bias score per dimension
 - Bias == Difference between two distributions (**all networks** vs. **networks with vantage points**)
 - **Bias score:** Kullback-Leibler divergence metric
 - i.e, a value between 0 (low bias) and 1 (high bias)
- Radar plot of bias
 - each radius → a bias dimension
 - colored lines/areas → bias score
 - high bias → far from center

Bias in Internet Measurement Platforms

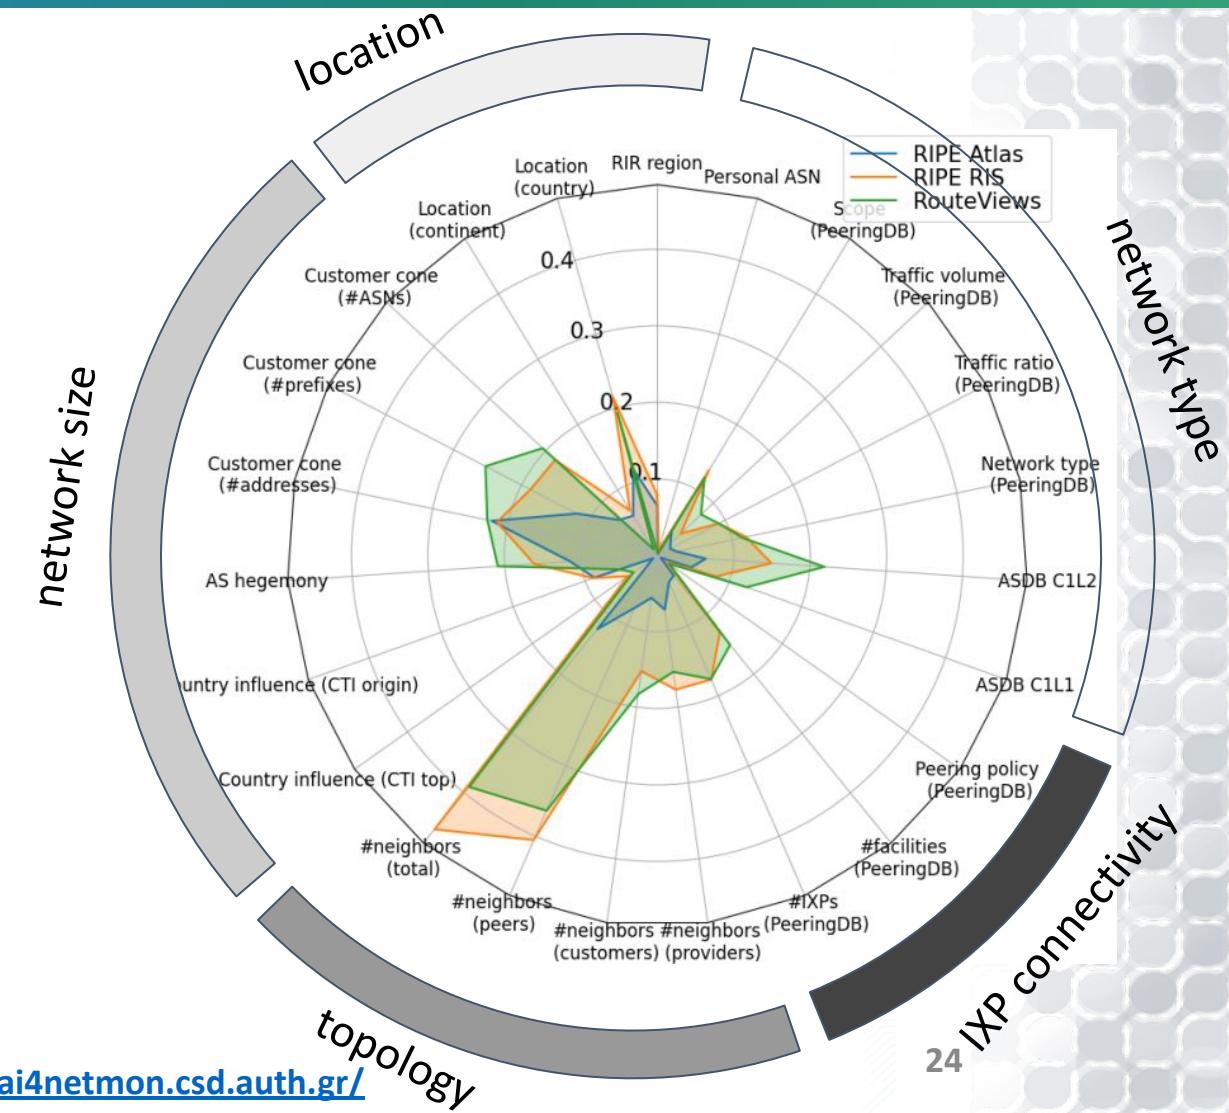

RIPE Atlas is significantly less biased than **RIPE RIS** and **RouteViews** in almost all dimensions

Bias in Internet Measurement Platforms

RIPE Atlas is significantly less biased than **RIPE RIS** and **RouteViews** in almost all dimensions

RIPE RIS has *high topology bias* (due to route collectors at IXPs) and *high network size bias* (peers are large networks)

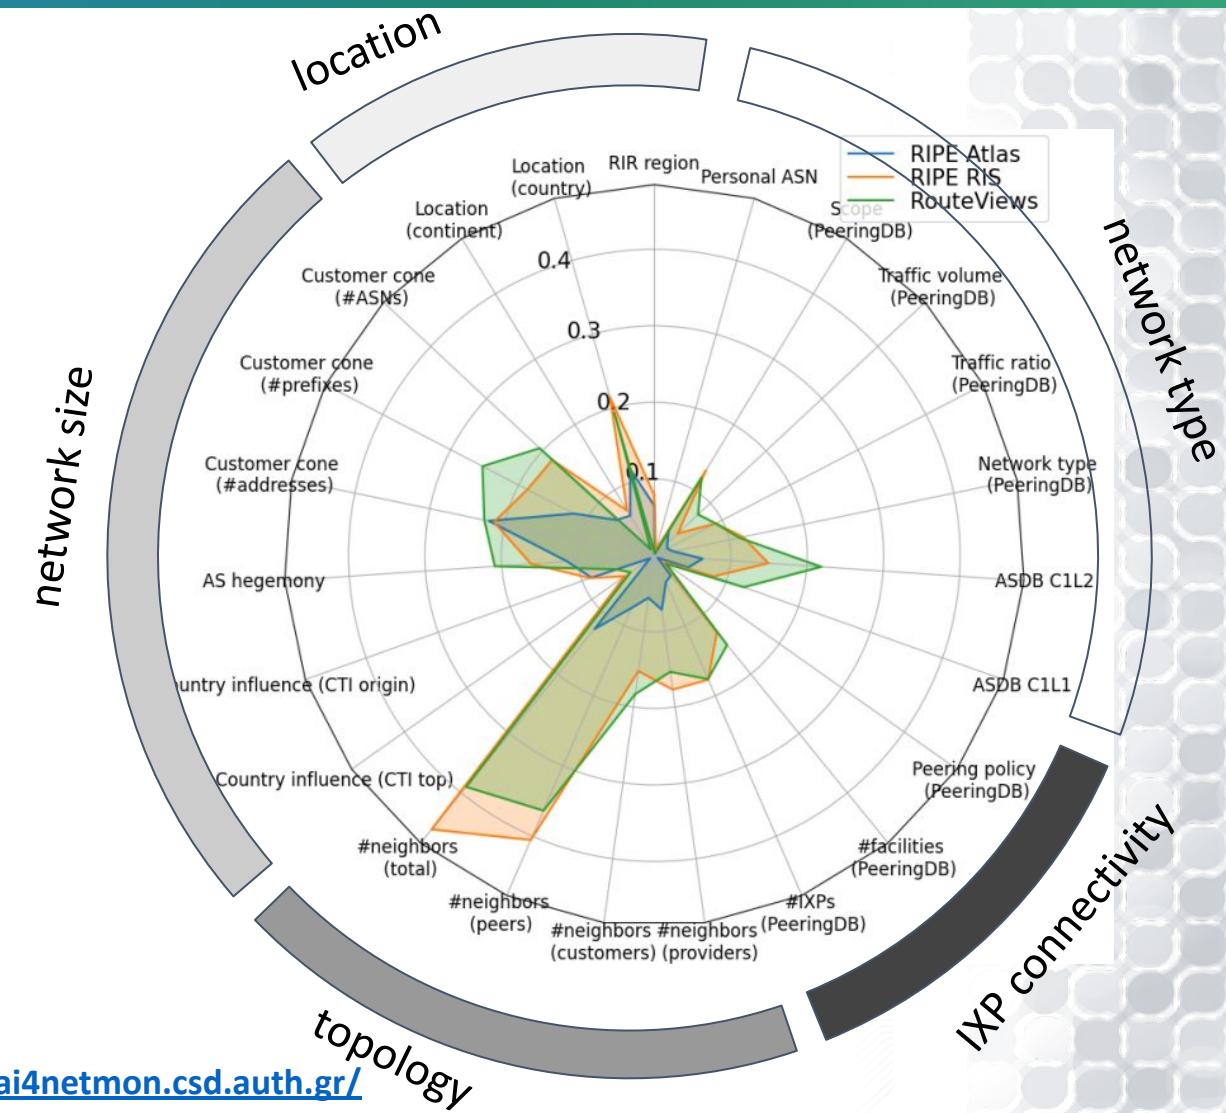

Bias in Internet Measurement Platforms

RIPE Atlas is significantly less biased than **RIPE RIS** and **RouteViews** in almost all dimensions

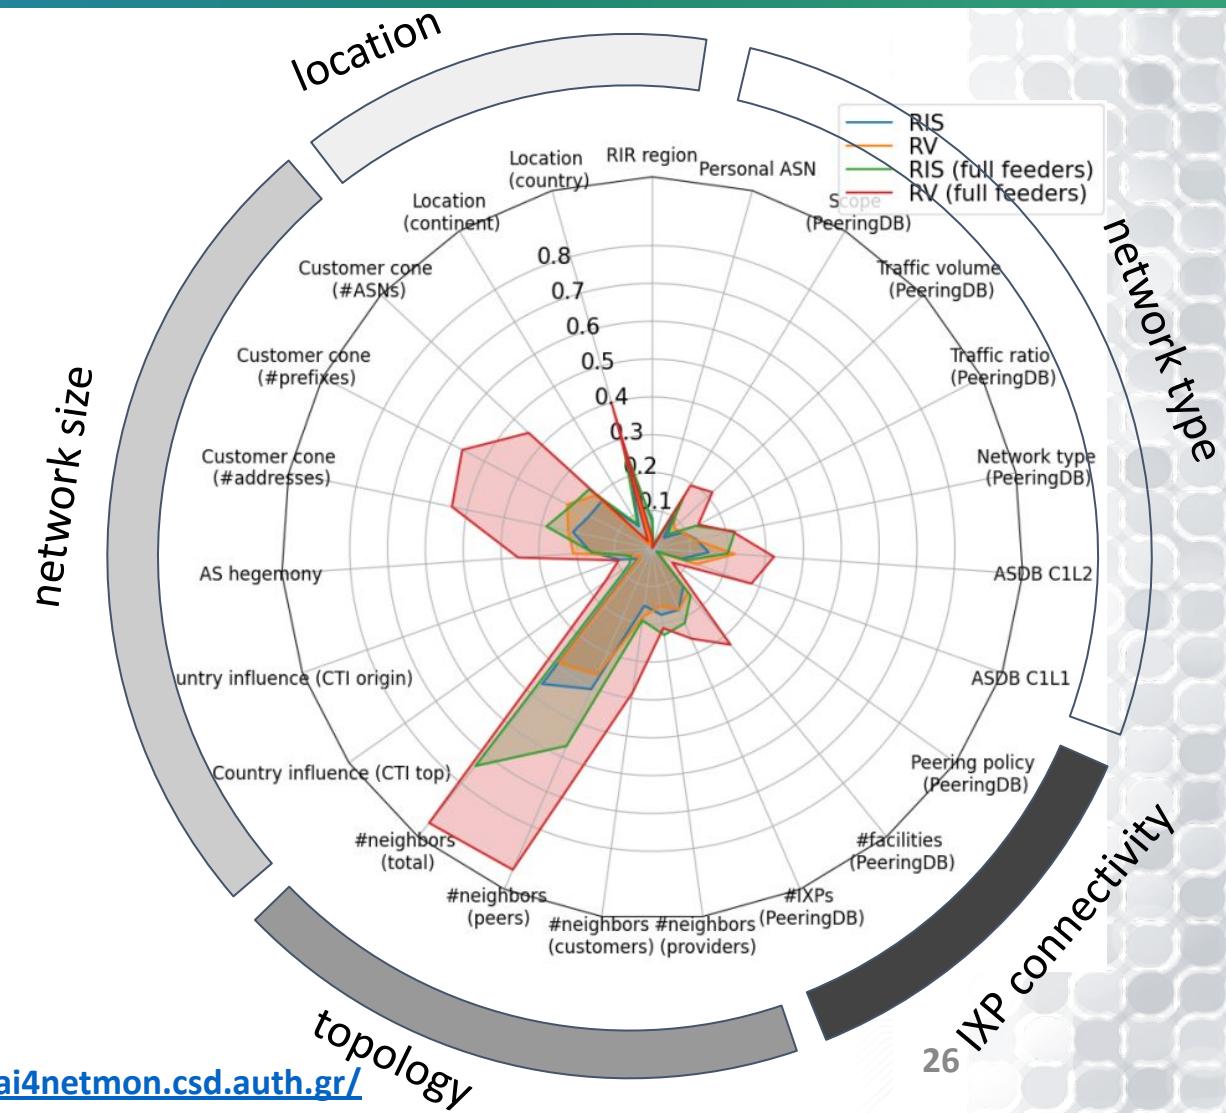

RIPE RIS has *high topology bias* (due to route collectors at IXPs) and *high network size bias* (peers are large networks)

RIPE Atlas, **RIPE RIS** and **RouteViews** have relatively *low network-type bias* (PeeringDB vs ASDB)

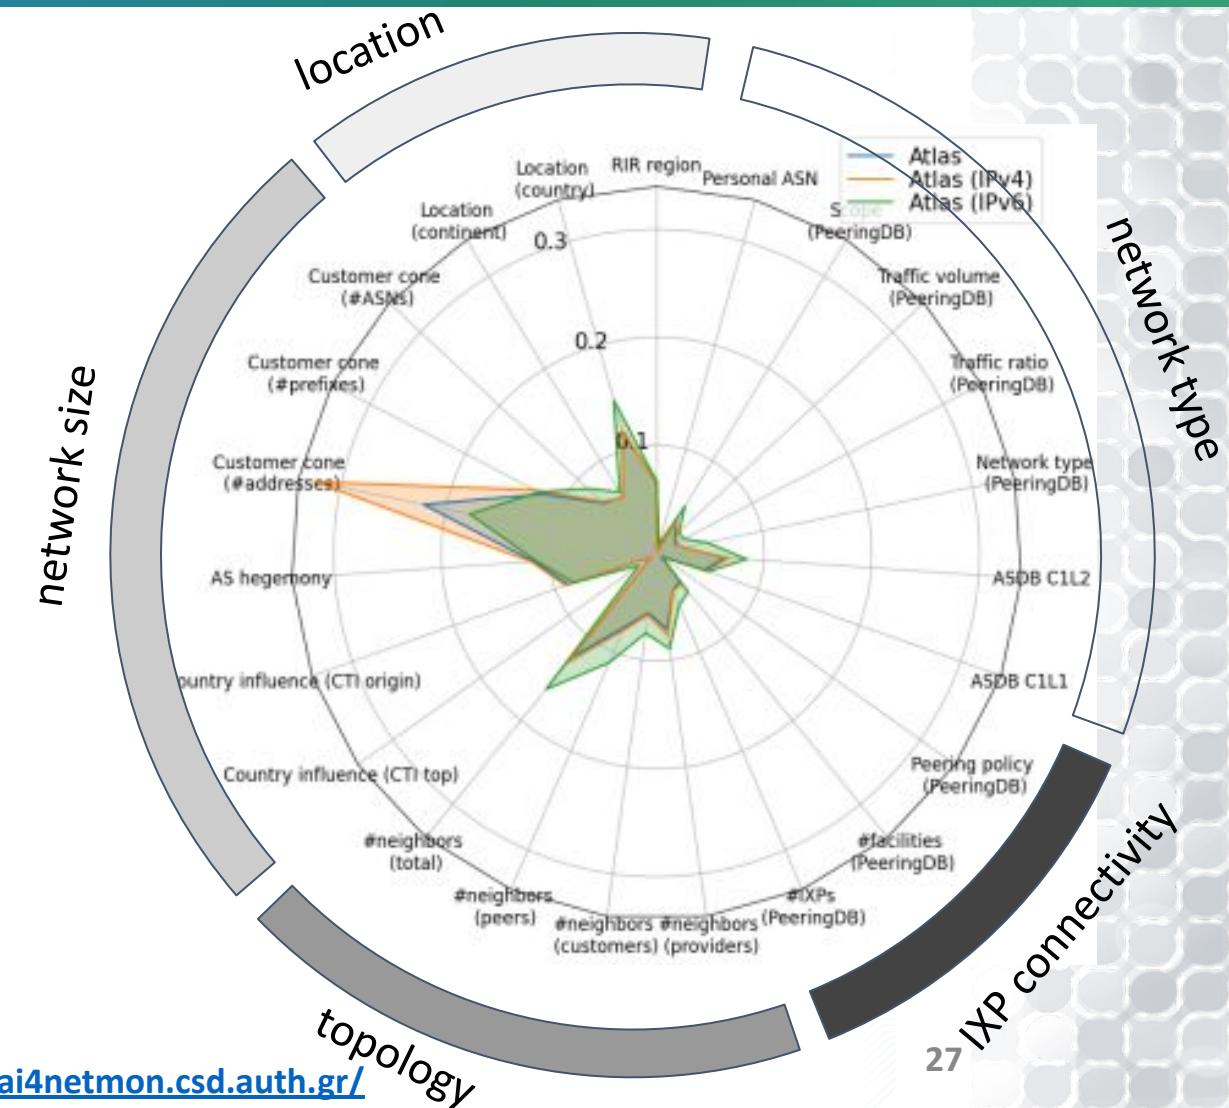

Bias in Internet Measurement Platforms

**Full feeds are
*more biased***

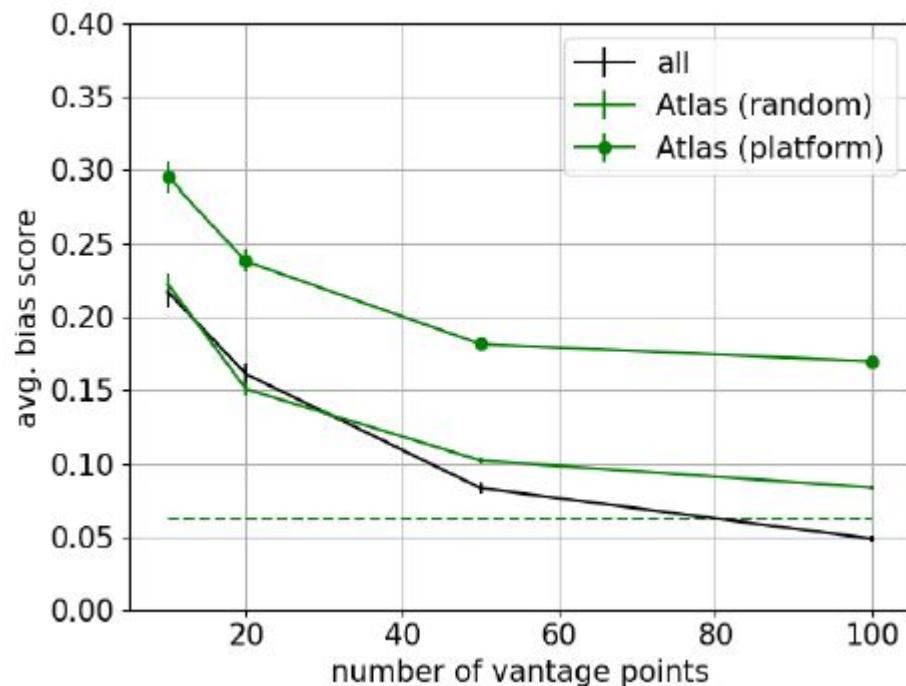

Bias in Internet Measurement Platforms

IPv6 Atlas probes are
only *slightly more*
biased than IPv4

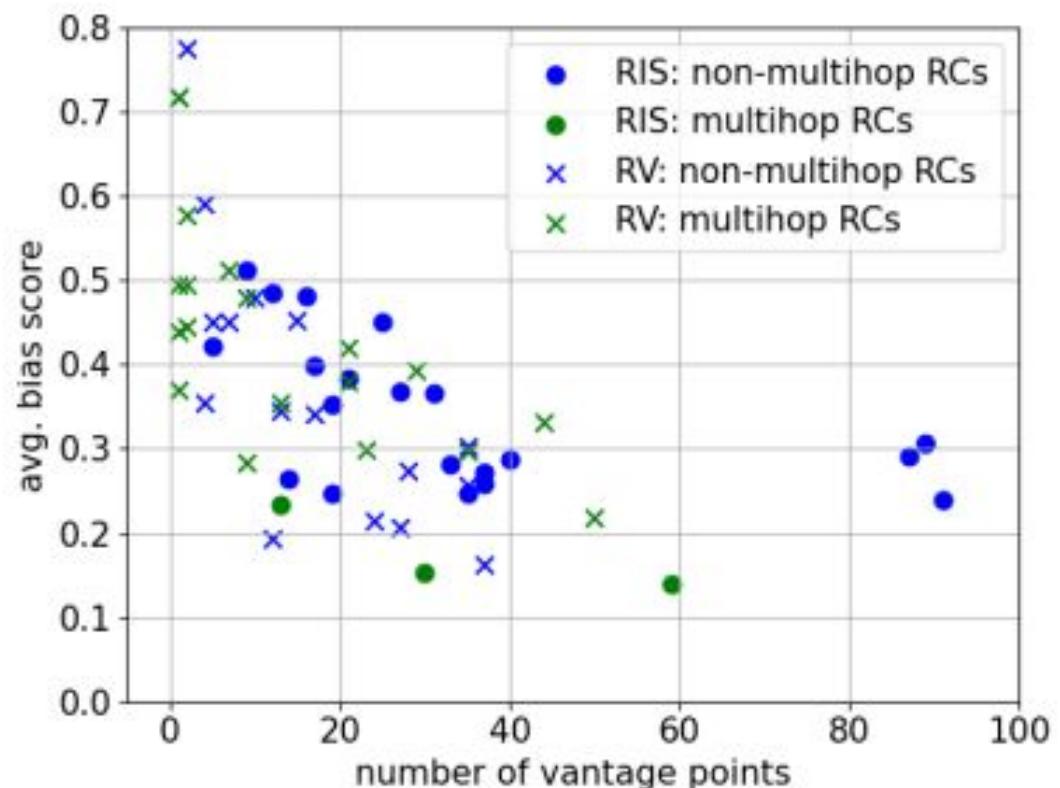

Bias in RIPE Atlas measurements with few probes

- Bias vs. number of probes
- Less probes → higher bias
- Automatic selection by Atlas (“Atlas platform”) is ***more biased*** than randomly selecting probes (“Atlas random”)!

Bias in RIPE RIS: per route collector analysis

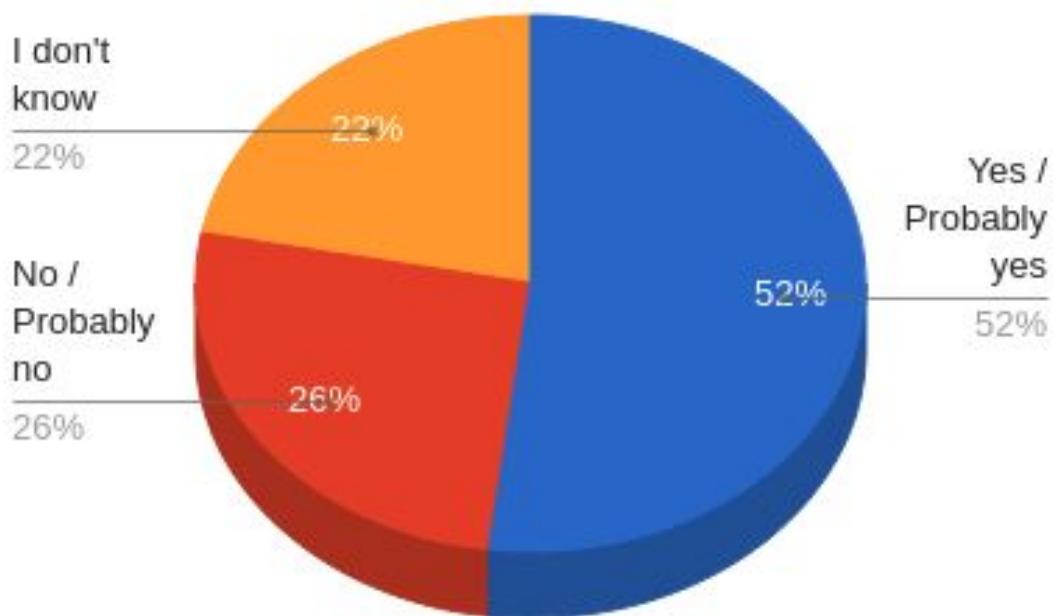

- Each route collector (RC) has different set of peering networks/ASes
- Bias is different for each RC
- Bias vs. number of peers

Do people know?

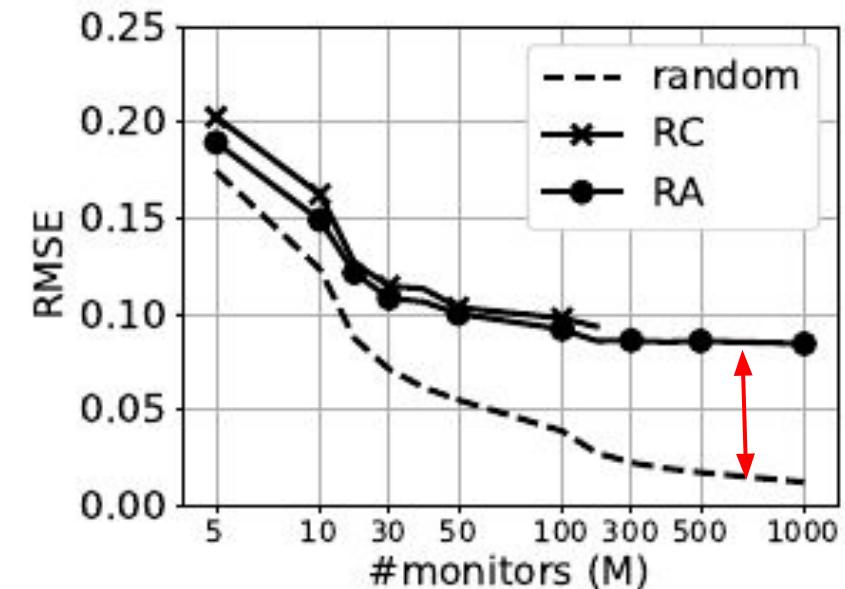

- Not all people know! → our main goal: raise awareness & deepen our understanding

Do you believe there is bias in Internet measurements?

So... what?

- Should I care? → Yes! Bias may affect the insights you get from your measurements
 - e.g., “*Estimating the Impact of BGP Prefix Hijacking*”, IFIP Networking, 2021 [[link](#)]
- Be aware of bias! Carefully interpret your results
 - “Which dimensions affect my measurements?”
 - “Is there bias in my dimensions?”

bias of public infrastructure

Summarizing...

- Our contributions
 - A framework (data, definitions, etc.) to quantify bias
 - Analysis of bias in Internet measurement platforms
 - Code & tools
 - Website <https://ai4netmon.csd.auth.gr/>
 - Web app <https://app-ai4netmon.csd.auth.gr/>

- Next steps
 - **Unbias** Internet measurements [ongoing work] :
 - (a) extend platforms (add extra vantage points)
 - (b) carefully select vantage points (subsampling)
 - **Use cases**: When the bias really hurts our findings?
 - **Bias in ML models** based on data from measurements
